

# Dimensionality Reduction

- Two common dimensionality reduction techniques are PCA and auto-encoders. Those techniques are sensitive to scale, so it is important to standardize the data and make it unitless. For this purpose, cell viability and gene expression features are standardized with standard scaler. For evaluating information loss in different dimensionality reduction techniques, latent space dimensions are set to half of cell viability and gene expression dimensions.

## PCA

- PCA is a linear transformation that projects the data into another space, where vectors of projections are defined by variance of the data. PCA results can be evaluated with reconstruction error and cumulative percent variance.

## Auto-encoder

- Auto-encoders are neural networks used for reducing data into a low dimensional latent space. Most important features lie in this low dimensional latent space because they are capable of reconstructing it. Auto-encoders are slower and computationally expensive compared to PCA, and they are also prone to overfitting.

## Conclusion

- For the given dataset it was observed that applying autoencoder the neural network model gives a logloss of 0.0128 & a val\_loss of 0.0192.
